

FACT SHEET

All-Electric Construction: A Good Deal for Maryland

All-electric building codes lead to lower construction costs in Maryland by encouraging developers to bypass the cost and complexity of installing new gas lines. These homes have roughly the same utility bills as mixed-fuel homes, which use both gas and electricity. Those savings are projected to improve over time as gas prices rise.

Building all-electric reduces upfront costs.

All-electric, single-family homes cost **\$35-40 less to construct in Maryland** than mixed-fuel homes, which use both gas and electricity.¹ Adopting an all-electric building code will reduce construction costs while allowing these homes to emit less carbon over time as more renewables power our electric grid.

“What about building electric-ready?”

While wiring new buildings to support electrical upgrades can reduce future costs of replacing gas equipment, it misses the opportunity to eliminate gas piping entirely. This approach ultimately costs more than building all-electric from the start.

Gas piping increases the cost to construct a typical single-family home in Maryland by **\$2,580²**.

BALTIMORE, MARYLAND

Building all-electric homes saves money in the most populous city in Maryland

MARYLAND STATEWIDE

Savings are comparable in other parts of the state

Simpler construction saves money.

All-electric homes cut out unnecessary materials and equipment. Constructing homes with gas requires a new underground extension from the gas main, a gas meter, and piping throughout the home to gas-powered appliances — an added cost of \$2,580 per home. These homes also typically have separate heating and air conditioning systems. All-electric homes operate without gas infrastructure and use a single efficient heat pump for heating and cooling.

New all-electric homes reduce utility bills.

A typical all-electric, single-family home constructed in Baltimore, Maryland will save \$510 per year on utility bills. That's 20% less than the annual utility bills for a Baltimore household living in a new home with gas.³ These savings largely come from utilizing heat pumps, which are 2–4 times more efficient than comparable gas appliances, for space heating and water heating.

These savings are expected to increase over time as gas prices continue to rise and utilities reform electric rate structures.⁴

This analysis incorporates rates from the largest utility in the state, covering 36% of residents. Rates in other parts of the state are often even more favorable for all-electric homes.

Volatile gas prices can unexpectedly strain budgets in mixed-fuel households.⁷

A typical all-electric home in Maryland will save

\$510

on utilities each year.

By 2030, gas prices are expected to increase as much as

130%⁵

Take action

Maryland policymakers can advance the economic benefits of all-electric homes in several ways:

- ▶ **Educate households and business owners** about incentives available for all-electric new buildings, including federal tax credits offered through the Inflation Reduction Act.
- ▶ **Support climate-aligned utility rate reform** that promotes all-electric buildings, including shifting toward higher fixed costs or a tiered time-of-use structure.
- ▶ **Establish a timeline and phasing plan** for adopting all-electric codes.
- ▶ **Phase out gas line extension allowances** to prevent the cost of new gas lines from being subsidized by ratepayers.
