All-Electric Buildings: Key to Achieving Wisconsin's Climate Goals

To cut Wisconsin's carbon emissions in line with critical climate targets, we must stop burning fossil fuels in buildings. Heat pumps are a readily available and effective solution for reducing building emissions today.

Buildings are a major source of carbon emissions

55% of Wisconsin's energy-related carbon emissions come from buildings.¹ Of this, over one third stems from burning fossil fuels (gas, oil, and propane) for heating, cooking, hot water, and other uses. Despite progress decarbonizing other sectors, these **emissions have only decreased by 4% in Wisconsin since 2016.**¹ The good news is that we have better technology at our fingertips and can convert these fuel-burning appliances to heat pumps and other efficient, electric systems.

“Why are we transitioning off gas?”

Methane gas (a.k.a. natural gas) served as a “bridge fuel” in the transition away from dirtier forms of energy like coal. That need has changed as Wisconsin has increasingly adopted renewable energy, reducing electric grid emissions by 27% since 2010.¹ It's time to take the next step in the energy transition by harnessing this cleaner grid to power our buildings.

Heat pumps are two efficient appliances in one

Heat pumps are so efficient because **they move heat rather than make heat.** In winter a heat pump gathers warmth from the air or ground (even in sub-zero temperatures) and moves it indoors. That flow is reversed to cool buildings in summer by moving heat outdoors. Heat pumps can replace both a furnace and an air conditioner. Plus, they can be used in water heaters, clothes dryers, and other appliances.

89%
of Wisconsin homes burn fuels on-site for cooking, heat, or hot water.²

81%
of commercial buildings in Wisconsin's region burn fuels on-site.³

All-electric buildings reduce carbon emissions

Replacing fossil fuel appliances with electric heat pumps dramatically reduces carbon emissions from buildings in Wisconsin. This is because **heat pumps are 2 to 4 times more efficient than gas appliances.** The carbon savings are even more significant when replacing oil and propane systems, and will only improve as Wisconsin's electricity grid continues to get cleaner.

Lifetime gas and electric appliance emissions in Wisconsin⁴

It's time to start the transition off gas

Transitioning from gas to electric is a necessary step toward a zero-carbon future, but we're moving in the wrong direction: **spending on gas continues to rise** as distribution networks sprawl and aging pipelines create leaks and safety concerns. An equitable transition to all-electric buildings requires careful planning that acknowledges the complexities of the current system and the workers and residents who rely on it. Several states have initiated this process, recognizing it's far more efficient and cost-effective to start planning now.

Gas distribution spending in the U.S. has more than tripled since 2009⁷

GAS IS STILL GROWING

Since 2020, utilities in Wisconsin have extended gas service to over

12,000
new customers.⁵

.....

An average of
545 miles
of new gas lines are laid per year in Wisconsin.⁶ These can remain in commission for decades.

Gas equipment and pipelines leak methane, a greenhouse gas 30 times more potent than carbon dioxide. These leaks can **double the climate impact** of gas use in buildings but are often ignored.⁷

Take action

Wisconsin can help accelerate the transition to all-electric buildings in several ways:

- ▶ **Adopt a state stretch code** that allows local governments to require or strongly incentivize all-electric buildings in new construction and major renovations.
- ▶ **Establish coordinated programs and incentives** for all-electric buildings utilizing federal funding from the Inflation Reduction Act.

- ▶ **Educate community members** about the importance of building electrification and available programs.
- ▶ **Petition the Public Service Commission of Wisconsin** to open a stakeholder process to bring utility regulation and planning in line with state climate goals.
